Summary

BS Artificial Intelligence student at FAST National University focused on building intelligent systems. Experienced in designing retrieval-augmented generation (RAG) pipelines, autonomous AI agents, and automated workflows that turn research into practical, shipping software. Comfortable across the full loop: clean data, dependable retrieval, sensible prompts, and APIs other developers can actually use.

Education

BS Artificial Intelligence — FAST National University (NUCES)

In Progress

Coursework spans machine learning, systems design, and applied AI, paired with hands-on projects building production-style AI software outside the classroom.

Project Experience

RAG Knowledge Base System

Personal Project — LangChain, ChromaDB, FastAPI

- Built a retrieval-augmented question-answering system that indexes private document sets.
- Returns grounded, cited answers by combining vector search with structured prompting.

Autonomous AI Agent Workflow

Personal Project — LlamaIndex, n8n, Python

- Designed a multi-step agent that plans, calls tools, and completes tasks end-to-end.
- Used n8n to handle surrounding automation, triggers, and integration with external services.

Smart API Microservice

Personal Project — FastAPI, PyTorch, Docker

- Wrapped a fine-tuned model behind a clean REST interface for low-latency inference.
- Structured the service for production use, including containerized deployment.

Skills

Languages	Python, C++
Generative AI & Architecture	RAG, LangChain, LlamaIndex, Prompt Engineering
Vector Databases & Tools	ChromaDB, Pinecone, n8n Automation
Frameworks & Web	PyTorch, Scikit-Learn, FastAPI, Git/GitHub
